                        ; RETRODOS.SYS (PCDOS 7.1 Kernel) - RETRO DOS v5.0 by ERDOGAN TAN - 12/09/2023
                        ; ----------------------------------------------------------------------------
                        ; Last Update: 06/08/2025 - Retro DOS v5.0 (Modified PCDOS 7.1)
                        ; ----------------------------------------------------------------------------
                        ; Beginning: 26/12/2018 (Retro DOS 4.0), 01/10/2022 (Retro DOS 4.2)
                        ; ----------------------------------------------------------------------------
                        ; Assembler: NASM version 2.15
                        ; ----------------------------------------------------------------------------
                        ;      ((nasm retrodos5.s -l retrodos5.txt -o PCDOS.SYS -Z error.txt))
                        ; ----------------------------------------------------------------------------
                        ; Included binary file: IBMDOS7.BIN (Retro DOS 5.0 - PCDOS 7.1 IBMDOS.COM)
                        ; ****************************************************************************
                        ;

                        ; 12/09/2023 - Retro DOS v5.0 Kernel -dosbios- ('ibmbio7.s')
                        ; Modified from 'iosys6.s' (11/09/2023, Retro DOS v4.2 Kernel's IO.SYS) file
                        ; as below:
                        ;
                        ;    1) Retro DOS v4.2 IO.SYS is based on disassembled source code
                        ;   of MSDOS 6.21 IO.SYS, derived using MSDOS 6.0 source code.
                        ;
                        ;    2) Labels, names, comments, explanations and structure definitions
                        ;   about procedures and code details are almost entirely taken from
                        ;   the original MSDOS 6.0 source code, except for the details that
                        ;   Erdogan Tan personally experienced. Some of them are incompatible
                        ;   with PCDOS 7.1 code. But they have not been deleted to preserve
                        ;   the originality of the descriptions.)
                        ;
                        ;    3)'ibmbio7.s' contains the BIOSLOADER (MSLOADER) section located in
                        ;   the 1st 4 sectors of the IBMBIO.COM file on disk. This is a method
                        ;   from older DOS versions (3 sectors for MSDOS 6.22).
                        ;   The MSDOS/PCDOS boot sector code only reads these MSLOADER/BIOSLOADER
                        ;   sectors and transfers control to the MSLOADER/BIOSLOADER code.
                        ;   BUT!!! The Retro DOS v3 (& v5) boot sector code loads the entire
                        ;   MSDOS.SYS/PCDOS.SYS -combined- kernel file into memory at once.
                        ;   So, hence the Retro DOS boot sector code, 'retrodos5.s' file
                        ;       contains slightly different IO.SYS/IBMBIO.COM INITialization code
                        ;   than the original PCDOS/MSDOS. It does not include
                        ;   the MSLOADER/BIOSLOADER section. The 'retrodos5.s' and 'ibmbio7.s'
                        ;   files are almost identical except their INIT codes.)
                        ;
                        ; ('iosys6.s' has been converted to 'ibmbio7.s' and 'retrodos42.s' has been
                        ; converted to 'retrodos5.s'. 'ibmbio7.s' is IBMBIO.COM source code file
                        ; while 'retrodos5.s' is source code of Retro DOS v5 kernel file 'PCDOS.SYS'.
                        ; 'retrodos5.s' includes 'ibmdos7.bin' or IBMDOS.COM as binary file.)

                        ; ----------------------------------------------------------------------------

                        ; 20/12/2022 - Modifications for initiating IO.SYS by Retro DOS v2 boot sector
                        ;
                        ;          (Retro DOS v2 BS loads IO.SYS & MSDOS.SYS as single kernel file
                        ;          with name of 'MSDOS.SYS'. Retro DOS init code -for IO.SYS init-
                        ;          is different than original MSDOS IO.SYS LOADER and INIT code.)
                        ;
                        ;          ((RETRODOS.SYS/MSDOS.SYS can be loaded by a fake IO.SYS for
                        ;          using it with MSDOS 5.0 boot sector & as bootable MSDOS disk.
                        ;          For that, fake IO.SYS must load 'MSDOS.SYS' at 1000h:0000h.))
                        ;
                        ; 18/12/2022 - Modified MSDOS 5.0 IO.SYS (for using with MSDOS 5 boot sector)
                        ; 09/12/2022 - Multisection binary file format (BIOSDATA & BIOSCODE sections)
                        ; 01/10/2022 - Erdogan Tan (Istanbul)

                        ;Note: This code is a part of Retro DOS 4.0 kernel source code
                        ;     (as included binary, 'IOSYS5.BIN')
                        ;     Equivalent of MSDOS 5.0 IO.SYS, BIOSCODE and BIOSDATA and SYSINIT
                        ;                                             (except MSLOAD code)

                        ;------- Retro DOS v2 (v3) boot sector loads RETRODOS.SYS (MSDOS.SYS)
                        ;    at 1000h:0000h and loader (initialization) part of RETRODOS kernel
                        ;    moves IO.SYS (DOSBIOSCODE & DOSBIOSDATA, 'IOSYS5.BIN') to 70h:0000h.
                        ;    Then SYSINIT code to the next segment (46Dh for original MSDOS 5.0)..
                        ;    SYSINIT code relocates itself and DOSBIOSCODE and MSDOS.SYS
                        ;    (MSDOS5.BIN) according to request/setting in 'config.sys' file.

1254
1255                                  ; (MSDOS 3.3) NOTE:
1256                                  ; Some floppy drives do not have changeline support. The result is a
1257                                  ; large amount of inefficiency in the code. A media-check always returns
1258                                  ; "I don`t know". This cause DOS to reread the FAT on every access and
1259                                  ; always discard any cached data.
1260                                  ;    We get around this inefficiency by implementing a "Logical Door Latch".
1261                                  ; The following three items are used to do this. The logical door latch is
1262                                  ; based on the premise that it is not physically possible to change floppy
1263                                  ; disks in a drive in under two seconds (most people take about 10). The
1264                                  ; logical door latch is implemented by saving the time of the last successful
1265                                  ; disk operation (in the value TIM_DRV). When a new request is made the
1266                                  ; current time is compared to the saved time. If less than two seconds have
1267                                  ; passed then the value "No Change" is returned. If more than two seconds
1268                                  ; have passed the value "Don't Know" is returned.
1269                                  ;    There is one complecation to this algorithm. Some programs change the
1270                                  ; value of the timer. In this unfortunate case we have an invalid timer.
1271                                  ; This possibility is detected by counting the number of disk operations
1272                                  ; which occur without any time passing. If this count exceeds the value of
1273                                  ; "AccessMax" we assume the counter is invalid and always return "Don't
1274                                  ; Know". The variable "AccessCount" is used to keep track of the number
1275                                  ; of disk operation which occur without the time changing.

8382                                ; IBM DOS 3.30 doesn't seem to mind that the TOTAL_SECTORS and
8383                                ; BIG_TOTAL_SECTORS field in the boot sector are 0000. This
8384                                ; happens with some frequency -- perhaps through some OS/2 setup
8385                                ; program. We haven't actually been COPYING the TOTAL_SECTORS
8386                                ; from the boot sector into the DPB anyway, we've just been using
8387                                ; it for calculating the fat size. Pretty scary, huh? For now,
8388                                ; we'll go ahead and copy it into the DPB, except in the case
8389                                ; that it equals zero, in which case we just use the values in
8390                                ; the DPB from the partition table.

                                ; this is special support for the pc convertible / nmi handler
                                ;
                                ;   on the pc convertible, there is a situation where an nmi can be
                                ;   caused by using the "out" instructions to certain ports. when this
                                ;   occurs, the pc convertible hardware *guarantees* that **nothing**
                                ;   can stop the nmi or interfere with getting to the nmi handler. this
                                ;   includes other type of interrupts (hardware and software), and
                                ;   also includes other type of nmi's. when any nmi has occured,
                                ;   no other interrtupt (hardware, software or nmi) can occur until
                                ;   the software takes specific steps to allow further interrupting.
                                ;
                                ;   for pc convertible, the situation where the nmi is generated by the
                                ;   "out" to a control port requires "fixing-up" and re-attempting. in
                                ;   otherwords, it is actually a "restartable exception". in this
                                ;   case, the software handler must be able to get to the stack in
                                ;   order to figure out what instruction caused the problem, where
                                ;   it was "out"ing to and what value it was "out"ing.  therefore,
                                ;   we will not switch stacks in this situation. this situation is
                                ;   detected by interrogating port 62h, and checking for a bit value
                                ;   of 80h. if set, *****do not switch stacks*****.

                                ; Now, if this is not romdos, we decide what to do with the DOS code.
                                ; It will either be relocated to low memory, above the DOS data structures,
                                ; or else it will be located in HiMem, in which case a stub with the DOS
                                ; code entry points will be located in low memory. Dos_segreinit is used
                                ; to tell the DOS data where the code has been placed, and to install the
                                ; low memory stub if necessary. If the DOS is going to go into HiMem, we
                                ; must first initialize it in its present location and load the installable
                                ; device drivers. Then, if a HiMem driver has been located, we can actually
                                ; relocate the DOS code into HiMem.
                                ;
                                ; For ROMDOS, if DOS=HIGH is indicated, then we need to call dos_segreinit
                                ; to install the low memory stub (this must be done before allowing any
                                ; device drivers to hook interrupt vectors). Otherwise, we don't need to
                                ; call dos_segreinit at all, since the interrupt vector table has already
                                ; been patched.

27017                                   ;   system design group requests bios to handle the phantom interrupts.
```

```
                                ;
                                ;   the "phantom" interrupt is an illegal interrupt such as an interrupt
                                ;   produced by the bogus adapter card even without interrupt request is
                                ;   set.  more specifically, 1). the 8259 has a feature when running in
                                ;   edge triggered mode to latch a pulse and present the interrupt when
                                ;   the processor indicates interrupt acknowledge (inta). the interrupt
                                ;   pulse was exist at the time of inta to get a "phantom" interrupt.
                                ;   2). or, this is caused by adapter cards placing a glitch on the
                                ;   interrupt line.
                                ;
                                ;   to handle those "phantom" interrupts, the main stack code will check
                                ;   the own firstflag, and if it is not "first" (which means the forward
                                ;   pointer points to the legal shared interrupt handler), then pass the
                                ;   control. if it is the first, then the following action should be
                                ;   taken. we don't have to implement skack logic in this case.
                                ;
                                ;   to implement this logic, we rather choose a simple method.
                                ;   if ont of the above "firstflag" conditions is met, we are not
                                ;   going to hook this interrupt vector. the reason is if the original
                                ;   vector points to "iret" and do nothing, we don't need
                                ;   to implement the stack logic for it. this will simplify implementation
                                ;   while maintaining compatibility with the old version of dos.
                                ;   this implies that in the main stack code, there might be a stack code
                                ;   that will never be used, a dead code.

                        ;******************************************************************************
                        ;
                        ; This file contains routines needed to parse and implement user-given
                        ; command-line options of the form "/S/L:3,0x500;2;7,127;0x0BE4". InitVar()
                        ; and Parsevar() are used to parse this data and place it in encoded form into
                        ; the variables in highvar.inc, for use by the rest of the routines.
                        ;
                        ; DeviceHigh accepts this command-line (handled in sysconf.asm, not here):
                        ;    DEVICEHIGH SIZE=hhhhhh module opts
                        ; Or, DeviceHigh and LoadHigh accept any of the following:
                        ;    DH/LH module opts
                        ;    DH/LH [/S][/L:umb[,size][;umb[,size]]*] module opts
                        ;    DH/LH [/L:umb[,size][;umb[,size]]*][/S] module opts
                        ; The initial UMB,SIZE pair designates the module's load address; the remainder
                        ; of the UMB and SIZE pairs are used to indicate specific UMBs to be left
                        ; available during the load.
                        ;
                        ; When an actual load is ready to be performed, a call to HideUMBs() will
                        ; temporarily allocate (as owner 8+"HIDDEN  ") all free elements in any
                        ; upper-memory block which was not specified by the user... in addition, if
                        ; UMBs were marked to shrink (/S option) to a certain size ("umb,size"), any
                        ; elements in that umb SAVE the lower-half of the newly-shrunken one are also
                        ; allocated. After the load, the function UnHideUMBs() (in highexit.inc) will
                        ; free any UMBs so allocated.
                        ;
                        ; When a device driver loads, there is the additional problem of allocating its
                        ; initial load site; this should be restricted to the first UMB specified on
                        ; the command-line. The function FreezeUM temporarily allocates all remaining
                        ; free upper-memory elements (as owner 8+"FROZEN  "), except those in the load
                        ; UMB. Then the initial allocation may be made, and a call to UnFreeze will
                        ; return any so-allocated memory elements to FREE, for the true load. Note
                        ; that UnFreeze leaves HIDDEN elements allocated; it only frees FROZEN ones.
                        ;

                                ;    "/S/L:1,200;2 module options"
                                ; Optionally, the string can begin with whitespace; neither /S nor /L is
                                ; required, though that's what this routine is supposed to parse.
                                ;
                                optS        equ     'S'     ; /S
                                optL        equ     'L'     ; /L:...
                                ;
                                ; ----------------------------------------------------------------------------
                                ; LoadHigh has a list of arguments, returned by cparse, which is used to create
                                ; a command-line for spawning a child process. For a typical LH command, say,
                                ;     lh /l:1,1000;2 print/d:lpt2
                                ; the arguments would look like (one per line):
                                ;     lh
                                ;     /l
                                ;     1
                                ;     1000
                                ;     2
                                ;     print
                                ;     /d
                                ;     :lpt2
                                ; In short, if "print" were, say, "43", there'd be no way to determine which
                                ; arg was the filename. So, inside this routine, we keep a running counter
                                ; of the number of arguments LH will need to skip in order to get to the
                                ; program name. The "lh" is implicit--it'll always have to skip that. So if
                                ; there's no "/l" or "/s", fm_argc will be 0 ... other than that, 1 is added
                                ; for:
                                ;    Each /L
                                ;    Each /S (there should be only one)
                                ;    Each UMB number (they follow ":" or ";")
                                ;    Each UMB size   (they follow ",")
                                ; So, in the above example, fm_argc would be 4-- and LH would skip right to
                                ; "print".  Note that InitVar initializes fm_argc to zero.
                                ; ----------------------------------------------------------------------------

                                ; Multiple configuration block support  Created 16-Mar-1992 by JeffPar
                                ;
                                ; Summary:
                                ;
                                ;   The procedure "organize" crunches the in-memory copy of config.sys
                                ;   into lines delimited by CR/LF (sometimes no CR, but *always* an LF)
                                ;   with the leading "keyword=" replaced by single character codes (eg, B
                                ;   for BUFFERS, D for DEVICE, Z for any unrecognized keyword); see comtab
                                ;   and/or config.inc for the full list.
                                ;
                                ;   [blockname] and INCLUDE are the major syntactical additions for multi-
                                ;   configuration support. blockname is either MENU, which contains one
                                ;   or more MENUITEM lines, an optional MENUDEFAULT (which includes optional
                                ;   time-out), or any user-defined keyword, such as NETWORK, CD-ROM, etc.
                                ;   INCLUDE allows the current block to name another block for inclusion
                                ;   during the processing phase of CONFIG.SYS. An INCLUDE is only honored
                                ;   once, precluding nasty infinite-loop scenarios. If blocks are present
                                ;   without a MENU block, then only lines inside COMMON blocks are processed.
                                ;
                                ; Example:
                                ;
                                ;   [menu]
                                ;   menuitem=misc,Miscellaneous
