                        ; RETRODOS.SYS (PCDOS 7.1 Kernel) - RETRO DOS v5.0 by ERDOGAN TAN - 12/09/2023
                        ; ----------------------------------------------------------------------------
                        ; Last Update: 19/01/2026 - Retro DOS v5.0 (Modified PCDOS 7.1)
                        ; ----------------------------------------------------------------------------
                        ; Beginning: 26/12/2018 (Retro DOS 4.0), 01/10/2022 (Retro DOS 4.2)
                        ; ----------------------------------------------------------------------------
                        ; Assembler: NASM version 2.15
                        ; ----------------------------------------------------------------------------
                        ;      ((nasm retrodos5.s -l retrodos5.txt -o PCDOS.SYS -Z error.txt))
                        ; ----------------------------------------------------------------------------
                        ; Included binary file: IBMDOS7.BIN (Retro DOS 5.0 - PCDOS 7.1 IBMDOS.COM)
                        ; ****************************************************************************
                        ;

                        ; 12/09/2023 - Retro DOS v5.0 Kernel -dosbios- ('ibmbio7.s')
                        ; Modified from 'iosys6.s' (11/09/2023, Retro DOS v4.2 Kernel's IO.SYS) file
                        ; as below:
                        ;
                        ;    1) Retro DOS v4.2 IO.SYS is based on disassembled source code
                        ;   of MSDOS 6.21 IO.SYS, derived using MSDOS 6.0 source code.
                        ;
                        ;    2) Labels, names, comments, explanations and structure definitions
                        ;   about procedures and code details are almost entirely taken from
                        ;   the original MSDOS 6.0 source code, except for the details that
                        ;   Erdogan Tan personally experienced. Some of them are incompatible
                        ;   with PCDOS 7.1 code. But they have not been deleted to preserve
                        ;   the originality of the descriptions.)
                        ;
                        ;    3)'ibmbio7.s' contains the BIOSLOADER (MSLOADER) section located in
                        ;   the 1st 4 sectors of the IBMBIO.COM file on disk. This is a method
                        ;   from older DOS versions (3 sectors for MSDOS 6.22).
                        ;   The MSDOS/PCDOS boot sector code only reads these MSLOADER/BIOSLOADER
                        ;   sectors and transfers control to the MSLOADER/BIOSLOADER code.
                        ;   BUT!!! The Retro DOS v3 (& v5) boot sector code loads the entire
                        ;   MSDOS.SYS/PCDOS.SYS -combined- kernel file into memory at once.
                        ;   So, hence the Retro DOS boot sector code, 'retrodos5.s' file
                        ;       contains slightly different IO.SYS/IBMBIO.COM INITialization code
                        ;   than the original PCDOS/MSDOS. It does not include
                        ;   the MSLOADER/BIOSLOADER section. The 'retrodos5.s' and 'ibmbio7.s'
                        ;   files are almost identical except their INIT codes.)
                        ;
                        ; ('iosys6.s' has been converted to 'ibmbio7.s' and 'retrodos42.s' has been
                        ; converted to 'retrodos5.s'. 'ibmbio7.s' is IBMBIO.COM source code file
                        ; while 'retrodos5.s' is source code of Retro DOS v5 kernel file 'PCDOS.SYS'.
                        ; 'retrodos5.s' includes 'ibmdos7.bin' or IBMDOS.COM as binary file.)

                        ; ----------------------------------------------------------------------------

                        ; 20/12/2022 - Modifications for initiating IO.SYS by Retro DOS v2 boot sector
                        ;
                        ;          (Retro DOS v2 BS loads IO.SYS & MSDOS.SYS as single kernel file
                        ;          with name of 'MSDOS.SYS'. Retro DOS init code -for IO.SYS init-
                        ;          is different than original MSDOS IO.SYS LOADER and INIT code.)
                        ;
                        ;          ((RETRODOS.SYS/MSDOS.SYS can be loaded by a fake IO.SYS for
                        ;          using it with MSDOS 5.0 boot sector & as bootable MSDOS disk.
                        ;          For that, fake IO.SYS must load 'MSDOS.SYS' at 1000h:0000h.))
                        ;
                        ; 18/12/2022 - Modified MSDOS 5.0 IO.SYS (for using with MSDOS 5 boot sector)
                        ; 09/12/2022 - Multisection binary file format (BIOSDATA & BIOSCODE sections)
                        ; 01/10/2022 - Erdogan Tan (Istanbul)

                        ;Note: This code is a part of Retro DOS 4.0 kernel source code
                        ;     (as included binary, 'IOSYS5.BIN')
                        ;     Equivalent of MSDOS 5.0 IO.SYS, BIOSCODE and BIOSDATA and SYSINIT
                        ;                                             (except MSLOAD code)

                        ;------- Retro DOS v2 (v3) boot sector loads RETRODOS.SYS (MSDOS.SYS)
                        ;    at 1000h:0000h and loader (initialization) part of RETRODOS kernel
                        ;    moves IO.SYS (DOSBIOSCODE & DOSBIOSDATA, 'IOSYS5.BIN') to 70h:0000h.
                        ;    Then SYSINIT code to the next segment (46Dh for original MSDOS 5.0)..
                        ;    SYSINIT code relocates itself and DOSBIOSCODE and MSDOS.SYS
                        ;    (MSDOS5.BIN) according to request/setting in 'config.sys' file.

1254
1255                                  ; (MSDOS 3.3) NOTE:
1256                                  ; Some floppy drives do not have changeline support. The result is a
1257                                  ; large amount of inefficiency in the code. A media-check always returns
1258                                  ; "I don`t know". This cause DOS to reread the FAT on every access and
1259                                  ; always discard any cached data.
1260                                  ;    We get around this inefficiency by implementing a "Logical Door Latch".
1261                                  ; The following three items are used to do this. The logical door latch is
1262                                  ; based on the premise that it is not physically possible to change floppy
1263                                  ; disks in a drive in under two seconds (most people take about 10). The
1264                                  ; logical door latch is implemented by saving the time of the last successful
1265                                  ; disk operation (in the value TIM_DRV). When a new request is made the
1266                                  ; current time is compared to the saved time. If less than two seconds have
1267                                  ; passed then the value "No Change" is returned. If more than two seconds
1268                                  ; have passed the value "Don't Know" is returned.
1269                                  ;    There is one complecation to this algorithm. Some programs change the
1270                                  ; value of the timer. In this unfortunate case we have an invalid timer.
1271                                  ; This possibility is detected by counting the number of disk operations
1272                                  ; which occur without any time passing. If this count exceeds the value of
1273                                  ; "AccessMax" we assume the counter is invalid and always return "Don't
1274                                  ; Know". The variable "AccessCount" is used to keep track of the number
1275                                  ; of disk operation which occur without the time changing.

12626                                   ;Setptrsav is also jumped to from dsk_init (msbio2.asm). In both cases, the
12627                                   ;pointer to be returned is in es:di. We were incorrectly returning ds:di.
12628                                   ;Note that this works in most cases because most pointers are in Bios_Data.
12629                                   ;It fails, for instance, when we install an external drive using driver.sys
12630                                   ;because then the BDS segment is no longer Bios_Data.
12631                                   ;NB: It is fine to corrupt cx because this is not a return value and anyway
12632                                   ;this returns to Chardev_entry (msbio1.asm) where all registers are
12633                                   ;restored before returning to the caller.

```

```
                        ;--------------------------------------------------------------
                        ;    SYSINIT is  a module linked behind the OEM bios.  It takes
                        ;over  the  system  initialization  after  the  OEM  bios   has
                        ;performed any  initialization  it  needs  to  do.   Control is
                        ;transfered with a long jump to the external  variable  SYSINIT
                        ;
                        ;
                        ;   The OEM  has  the  following  variables declared external:
                        ;
                        ;   CURRENT_DOS_LOCATION    WORD
                        ;
                        ;This word  contains  the  segment  number of the DOS before it
                        ;is relocated.  The OEM bios must set this value.
                        ;
                        ;   FINAL_DOS_LOCATION      WORD
                        ;
                        ;This word contains the segment number of the DOS after SYSINIT
                        ;moves it.  The OEM bios must set this value.
                        ;
                        ;   DEVICE_LIST             DWORD
                        ;
                        ;This  double  word  pointer  points  to  the  linked  list  of
                        ;character and block device drivers.  The  OEM  must  set  this
                        ;value.
                        ;
                        ;   MEMORY_SIZE             WORD
                        ;
                        ;This word  contains  the  number  of  RAM  paragraphs.  If the
                        ;bios doesn't set  this  variable  SYSINIT  will  automatically
                        ;calculate it.   NOTE:  systems with PARITY checked memory must
                        ;size memory in the BIOS.  SYSINITs method is to  write  memory
                        ;and read it back until it gets a mismatch.
                        ;
                        ;   DEFAULT_DRIVE           BYTE
                        ;
                        ;This is  the initial default drive when the system first comes
                        ;up.  drive a=0, drive b=1,  etc.   If  the  bios  doesn't  set
                        ;it then drive a is assumed.
                        ;
                        ;   BUFFERS                 BYTE
                        ;
                        ;This is  the  default  number of buffers for the system.  This
                        ;value may be overridden by the user in  the  CONFIG.SYS  file.
                        ;It is DBed to 2 in SYSINIT it should be greater than 1.
                        ;
                        ;   FILES                   BYTE
                        ;
                        ;This is  the  default  number  of  files for the system.  This
                        ;value may be overridden by the user in  the  CONFIG.SYS  file.
                        ;It is  DBed  to  8 in SYSINIT, values less than 5 are ignored.
                        ;
                        ;   SYSINIT                 FAR
                        ;
                        ;The entry  point  of  the  SYSINIT  module.  OEM BIOS jumps to
                        ;this label at the end of its INIT code.
                        ;
                        ;   The OEM  has  the  following  variables declared public:
                        ;
                        ;   RE_INIT                 FAR
                        ;
                        ;This is an entry point which allows the BIOS to do some INIT
                        ;work  after  the  DOS is initialized.  ALL REGISTERS MUST BE
                        ;PRESERVED.  On entry DS points to the first available memory
                        ;(after  the DOS).  DS:0 points to a 100H byte program header
                        ;prefix which represents  the  "program"  currently  running.
                        ;This  program  should  be  thought  of  as  the OEM BIOS and
                        ;SYSINIT taken together.  This is not  a  normal  program  in
                        ;that  no  memory  is  allocated to it, it is running in free
                        ;memory.
                        ;NOTES:
                        ;     At the time this routine is called SYSINIT occupies the
                        ;highest 10K of memory ("highest" is determined by the  value
                        ;of the MEMORY_SIZE variable), DO NOT DO WRITES THERE.
                        ;     Since this is called AFTER DOS is initialized, you can
                        ;make system calls.  This also implies that the code for this
                        ;routine    CANNOT   be   thrown   away   by   use   of   the
                        ;FINAL_DOS_LOCATION since the DOS has already been moved.
                        ;     If you don't want  anything done just set this to point
                        ;at a FAR RET instruction.

                                ; ****************************************************************************
                                ;
                                ; this is special support for the pc convertible / nmi handler
                                ;
                                ;   on the pc convertible, there is a situation where an nmi can be
                                ;   caused by using the "out" instructions to certain ports. when this
                                ;   occurs, the pc convertible hardware *guarantees* that **nothing**
                                ;   can stop the nmi or interfere with getting to the nmi handler. this
                                ;   includes other type of interrupts (hardware and software), and
                                ;   also includes other type of nmi's. when any nmi has occured,
                                ;   no other interrtupt (hardware, software or nmi) can occur until
                                ;   the software takes specific steps to allow further interrupting.
                                ;
                                ;   for pc convertible, the situation where the nmi is generated by the
                                ;   "out" to a control port requires "fixing-up" and re-attempting. in
                                ;   otherwords, it is actually a "restartable exception". in this
                                ;   case, the software handler must be able to get to the stack in
                                ;   order to figure out what instruction caused the problem, where
                                ;   it was "out"ing to and what value it was "out"ing.  therefore,
                                ;   we will not switch stacks in this situation. this situation is
                                ;   detected by interrogating port 62h, and checking for a bit value
                                ;   of 80h. if set, *****do not switch stacks*****.
                                ;

                                ;   the "phantom" interrupt is an illegal interrupt such as an interrupt
                                ;   produced by the bogus adapter card even without interrupt request is
                                ;   set.  more specifically, 1). the 8259 has a feature when running in
                                ;   edge triggered mode to latch a pulse and present the interrupt when
                                ;   the processor indicates interrupt acknowledge (inta). the interrupt
                                ;   pulse was exist at the time of inta to get a "phantom" interrupt.
                                ;   2). or, this is caused by adapter cards placing a glitch on the
                                ;   interrupt line.
                                ;
                                ;   to handle those "phantom" interrupts, the main stack code will check
                                ;   the own firstflag, and if it is not "first" (which means the forward
                                ;   pointer points to the legal shared interrupt handler), then pass the
                                ;   control. if it is the first, then the following action should be
                                ;   taken. we don't have to implement skack logic in this case.
                                ;
                                ;   to implement this logic, we rather choose a simple method.
                                ;   if ont of the above "firstflag" conditions is met, we are not
                                ;   going to hook this interrupt vector. the reason is if the original
                                ;   vector points to "iret" and do nothing, we don't need
                                ;   to implement the stack logic for it. this will simplify implementation
                                ;   while maintaining compatibility with the old version of dos.
                                ;   this implies that in the main stack code, there might be a stack code
                                ;   that will never be used, a dead code.

32015                                   ; There are two primary definitions which need to be made, selectively, before
32016                                   ; this include file should be used.  These are:
32017                                   ;    HV_Extern - If this has been defined, variables for this module will be
32018                                   ;                declared as external.  Otherwise, variables will be declared
32019                                   ;                public, as well as defined, here.  LoadHigh declares HV_Extern
32020                                   ;                in stub.asm and loadhi.asm, and does not declare it in
32021                                   ;                rdata.asm... DeviceHigh does not declare HV_Extern anywhere
32022                                   ;                (as only one module, sysconf.asm, includes this file).
32023                                   ;    HV_LoadHigh - This should be defined when this module is going into
32024                                   ;                  command.com, for LoadHigh.  All of loadhi.asm, stub.asm and
32025                                   ;                  rdata.asm define this, while io.sys' sysconf.asm does not.
32026                                   ;
32027                                   ;**************************************************************************
32028
32029                                   ; To keep track of which UMBs were specified on the DH/LH command lines, and
32030                                   ; to keep track of the minimum sizes given for each, there're two arrays kept
32031                                   ; in { IO.SYS: sysinitseg / COMMAND.COM: DATARES }... each is MAXUMB elements
32032                                   ; big.  16 should be around 14 too many for most users, so there's no expected
32033                                   ; space problem (it's just such a nice round number, eh?).
32034
32035                                   MAXUMB      equ     16
32036
32037                                   ; Memory elements owned by the system are marked as PSP address 8 in both the
32038                                   ; USA and Japan; Japanese systems also use 9 under more bizzarre conditions.
32039
32040                                   FreePSPOwner        equ     0       ; Free MCBs all have an owner PSP address of 0
32041                                   SystemPSPOwner      equ     8
32042                                   ;JapanPSPOwner      equ     9
32043
32044                                   ; for LoadHigh and DeviceHigh:
32045                                   ;
32046                                   ;   fInHigh - Is set to 1 during HideUMBs(), and back to zero in
32047                                   ;             UnHideUMBs().
32048                                   ;   fUmbTiny - Is set to 1 iff the user has specified /S on the command-
32049                                   ;              line.
32050                                   ;   SegLoad - Segment address for first UMB specified; set automatically.
32051                                   ;   UmbLoad - The load UMB number; for example, this is 3 if the user has
32052                                   ;             given a command-line like "/L:3,500;4"
32053                                   ;   UmbUsed - An array of characters, each of which is 1 iff the UMB
32054                                   ;             matching its index number was specified on the command-line;
32055                                   ;             for example, after "/L:3,500;4;7", UmbUsed[3], [4] and [7]
32056                                   ;             will be set to 1.  All others will be set to 0.
32057                                   ;   UmbSize - An array of words, each of which is interpereted as a size
32058                                   ;             specified by the user for a UMB (in the above example, all
32059                                   ;             elements would be zero save UmbSize[3], which would be 500.
32060                                   ;   fm_umb - Set to the old UMB link-state (0x80 or 0x00)
32061                                   ;   fm_strat - Set to the old memory-allocation strategy (0$00000???)
32062                                   ;   fm_argc  - Number of arguments received by ParseVar() (see ParseVar()
32063                                   ;              for details).

                                ; This routine exects ES:SI to point to a string much like the following:
                                ;    "/S/L:1,200;2 module options"
                                ; Optionally, the string can begin with whitespace; neither /S nor /L is
                                ; required, though that's what this routine is supposed to parse.
                                ;
                                optS        equ    'S'     ; /S
                                optL        equ    'L'     ; /L:...
                                ;
                                ; ---------------------------------------------------------------------------
                                ; LoadHigh has a list of arguments, returned by cparse, which is used to create
                                ; a command-line for spawning a child process. For a typical LH command, say,
                                ;     lh /l:1,1000;2 print/d:lpt2
                                ; the arguments would look like (one per line):
                                ;     lh
                                ;     /l
                                ;     1
                                ;     1000
                                ;     2
                                ;     print
                                ;     /d
                                ;     :lpt2
                                ; In short, if "print" were, say, "43", there'd be no way to determine which
                                ; arg was the filename. So, inside this routine, we keep a running counter
                                ; of the number of arguments LH will need to skip in order to get to the
                                ; program name. The "lh" is implicit--it'll always have to skip that. So if
                                ; there's no "/l" or "/s", fm_argc will be 0 ... other than that, 1 is added
                                ; for:
                                ;    Each /L
                                ;    Each /S (there should be only one)
                                ;    Each UMB number (they follow ":" or ";")
                                ;    Each UMB size   (they follow ",")
                                ; So, in the above example, fm_argc would be 4-- and LH would skip right to
                                ; "print".  Note that InitVar initializes fm_argc to zero.
                                ; ---------------------------------------------------------------------------

                                ; Multiple configuration block support  Created 16-Mar-1992 by JeffPar
                                ;
                                ; Summary:
                                ;
                                ;   The procedure "organize" crunches the in-memory copy of config.sys
                                ;   into lines delimited by CR/LF (sometimes no CR, but *always* an LF)
                                ;   with the leading "keyword=" replaced by single character codes (eg, B
                                ;   for BUFFERS, D for DEVICE, Z for any unrecognized keyword); see comtab
                                ;   and/or config.inc for the full list.
                                ;
                                ;   [blockname] and INCLUDE are the major syntactical additions for multi-
                                ;   configuration support. blockname is either MENU, which contains one
                                ;   or more MENUITEM lines, an optional MENUDEFAULT (which includes optional
                                ;   time-out), or any user-defined keyword, such as NETWORK, CD-ROM, etc.
                                ;   INCLUDE allows the current block to name another block for inclusion
                                ;   during the processing phase of CONFIG.SYS. An INCLUDE is only honored
                                ;   once, precluding nasty infinite-loop scenarios. If blocks are present
                                ;   without a MENU block, then only lines inside COMMON blocks are processed.
                                ;
                                ; Example:
                                ;
                                ;   [menu]
                                ;   menuitem=misc,Miscellaneous
                                ;   menuitem=network,Network Configuration
                                ;   menudefault=network,15
                                ;
                                ;   [network]
                                ;   include misc
                                ;   device=foo
                                ;
                                ;   [misc]
                                ;   device=bar
                                ;   include alternate
